

How much does each fixed rule miss the hindsight best?

$100 \times (\text{rule score} - \text{future minimum of all 10 candidates}) / \text{F0} \cdot \text{descriptive point regret; the oracle is unavailable at deployment}$

SORT · primary objective

QCAL · calibration interaction diagnostic

Head-six and LoRA-three family minima are reported separately in oracle_regret.json. No oracle-selected confidence interval is computed.

Exploratory reuse of two sources in two time blocks; one stored optimizer seed (12000), not four independent sources.
 Selections use original V only. C13 / E83 origins use H48 at a daily stride. QCAL uses C only and gives no coverage guarantee.
 CIs condition on saved checkpoints and fixed selectors. Hindsight oracle regret is descriptive and cannot be used for deployment.
