

Selected procedures on the future window

Dots: fixed optimizer seeds · diamonds: mean · bars: ± 1 sample SD across seeds (not a confidence interval)

○ SORT □ QCAL

H and OFF_LORA: $n = 3$ fixed seeds; F0 and RAW: one deterministic procedure each, no seed SD. Equal weights for the two targets.

Temporal replication on the next 190-day block of the same two sources; no isolated causal mechanism or new-source replication.

$L = 336$ h, $H = 48$ h; daily origins overlap by 24 h. $V_{\text{select}} / C_{\text{cal}}$: 13 origins each; evaluation: 83 origins. QCAL has no coverage guarantee.

Each temporal CI conditions on that block's frozen selections and three fitted seeds; it excludes selection/training uncertainty. Blocks 12/13 are not pooled.
