

Standard LoRA versus the selected output head

QCAL: $100 \times (\text{score}_H - \text{score_OFF_LORA}) / \text{score_F0}$ · positive values favor OFF_LORA

A Bike sharing · 5 inputs / 2 targets

B Household power · 4 inputs / 2 targets

97.5% CI per source; 7-day blocks define the two-source primary family. 3/14-day intervals are descriptive sensitivity, not extra entry tests.

Temporal replication on the next 190-day block of the same two sources; no isolated causal mechanism or new-source replication.

L = 336 h, H = 48 h; daily origins overlap by 24 h. V_select / C_cal: 13 origins each; evaluation: 83 origins. QCAL has no coverage guarantee.

Each temporal CI conditions on that block's frozen selections and three fitted seeds; it excludes selection/training uncertainty. Blocks 12/13 are not pooled.
