

Two time blocks, two separate estimates

QCAL: $100 \times (\text{score}_H - \text{score}_{\text{OFF_LORA}}) / \text{score}_{F0}$ · positive values favor OFF_LORA

A Bike sharing · 5 inputs / 2 targets

B Household power · 4 inputs / 2 targets

No pooled estimate, combined confidence interval, or cross-block difference test. A later result does not revise the earlier block's decision.

Temporal replication on the next 190-day block of the same two sources; no isolated causal mechanism or new-source replication.

L = 336 h, H = 48 h; daily origins overlap by 24 h. V_select / C_cal: 13 origins each; evaluation: 83 origins. QCAL has no coverage guarantee.

Each temporal CI conditions on that block's frozen selections and three fitted seeds; it excludes selection/training uncertainty. Blocks 12/13 are not pooled.
